

# 20 Years of the Best and Worst – A Case for Diversification

Everyone wants to be in the best-performing asset class every year. The thing is, few people are savvy enough to consistently choose the best. That's why diversification is key. This chart shows annual returns for eight broad-based asset classes, cash and a diversified portfolio ranked from best to worst. Notice how the "leadership" changes from year to year, and how competitively the diversified portfolio performed over 20 years (see the "annualized return" column).

Source: FactSet SPAR. Returns are in USD, and net for MSCI EAFE and gross for all other asset classes. Annualized return and standard deviation (annualized) is for the 20-year period ending December 31, 2025. The diversified portfolio is rebalanced quarterly to maintain the equal allocations throughout the period. Standard deviation reflects a portfolio's total return volatility, which is based on a minimum of 36 monthly returns. The larger the portfolio's standard deviation, the greater the portfolio's volatility. Asset allocation and diversification do not guarantee a profit or protect against a loss.

## IMPORTANT RISK CONSIDERATIONS

**International:** Investing in foreign and/or emerging market securities involves interest rate, currency exchange rate, economic, and political risks. These risks are magnified in emerging or developing markets as compared with domestic markets. **Small/Mid Cap stocks:** Investing in small and/or mid-sized companies involves more risk than that customarily associated with investing in more-established companies. **Bonds:** Bonds, if held to maturity, provide a fixed rate of return and a fixed principal value. Bond funds will fluctuate and, when redeemed, may be worth more or less than their original cost. **Commodity:** Commodity-related investments can be more volatile than investments in equity securities or debt instruments and can be affected by changes in overall market movements, commodity index volatility, changes in interest rates, currency fluctuations, or factors affecting a particular industry or commodity, and demand/supply imbalances in the market for the commodity. Events that affect the financial services sector may have a significant adverse effect on the portfolio. **Real Estate:** Real estate-related investments can be volatile because of general, regional, and local economic conditions, fluctuations in interest rates and property tax rates; shifts in zoning laws, environmental regulation and other governmental actions; increased operation expenses; lack of availability of mortgage funds; losses due to natural disasters; changes in property values and rental rates; overbuilding; losses due to casualty or condemnation, cash flows; the management skill and creditworthiness of the REIT manager, and other factors.

# Make diversification work for you

## Strike the proper balance

Diversification — spreading your assets among investment types, styles and markets — is one of the few time-tested strategies for investors with long-term financial goals. A well-diversified portfolio of stock and bond holdings may help reduce your exposure to the downside risks of individual holdings. As you can see in the charts to the right, stocks and bonds have historically performed differently over time.

## Stick to your plan

When tempted by current market conditions, investors should stay true to a long-term financial plan. We know the stock market buzz never stops. But desire and impulse are never good substitutes for rational thought and a disciplined plan. Look no further than the dot-com phenomenon to see a hot bubble burst.

Does this mean that you should put all of your money in just stocks? Or just bonds? No. Just because an investment type or style outperforms one year, there is no guarantee that it will outperform the next. Stay diversified.

## Stocks vs. bonds over the past 20 years

(2006 - 2025)

Annualized return

Calendar year outperformance

Stocks are represented by the **S&P 500 Index**, which measures the broad US stock market. Bonds are represented by the **Bloomberg US Aggregate Bond Index**, which measures the US bond market. The historical performance of each index cited is provided to illustrate market trends; it does not represent the performance of a particular MFS investment product. Index performance does not take into account fees and expenses.

## Risk/return profile: Stocks and bonds

(2006 - 2025)

**Standard deviation** is an indicator of the portfolio's total return volatility, which is based on a minimum of 36 months. The larger the portfolio's standard deviation, the greater the portfolio's volatility. Past performance is no guarantee of future results.

For more information on any MFS product, including performance, please visit [mfs.com](https://mfs.com). It is not possible to invest directly in an index.

Keep in mind that all investments carry a certain amount of risk including possible loss of the principal amount invested.

No investment strategy, including diversification and asset allocation, guarantees a profit or protects against a loss.

**Stock:** Stock markets and investments in individual stocks are volatile and can decline significantly in response to issuer, market, economic, industry, political, regulatory, geopolitical, environmental, public health, and other conditions. **Bond:** Investments in debt instruments may decline in value as the result of, or perception of, declines in the credit quality of the issuer, borrower, counterparty, or other entity responsible for payment, underlying collateral, or changes in economic, political, issuer-specific, or other conditions. Certain types of debt instruments can be more sensitive to these factors and therefore more volatile. In addition, debt instruments entail interest rate risk (as interest rates rise, prices usually fall), therefore the Fund's share price may decline during rising rates. Funds that consist of debt instruments with longer durations are generally more sensitive to a rise in interest rates than those with shorter durations. At times, and particularly during periods of market turmoil, all or a large portion of segments of the market may not have an active trading market. As a result, it may be difficult to value these investments and it may not be possible to sell a particular investment or type of investment at any particular time or at an acceptable price. The price of an instrument trading at a negative interest rate responds to interest rate changes like other debt instruments; however, an instrument purchased at a negative interest rate is expected to produce a negative return if held to maturity.

**1 FTSE 3-month Treasury Bill Index** tracks the daily performance of 3-month US Treasury bills. **2 Bloomberg U.S. Aggregate Bond Index** measures the US bond market. **3 Bloomberg Global Aggregate Index (Unhedged)** provides a broad-based measure of the global investment-grade fixed income markets. **4 Russell 1000® Value Index** measures large-cap US value stocks. **5 Bloomberg Commodity Index** is composed of futures contracts on physical commodities. **6 Russell 1000® Growth Index** measures US large-cap growth stocks. **7 MSCI EAFE Index** measures the non-US stock market. **8 Russell 2500 Index** measures small- and mid-cap US stocks. **9 FTSE NAREIT All REITs Total Return Index** tracks the performance of commercial real estate across the US economy.
