

READY TO RETIRE?

When planning for income, consider how the sequence of returns could impact a portfolio's value over time

The sequence of returns matters

When an investor starts taking withdrawals, the sequence of positive and negative annual returns may be more critical to how long the assets last than the average annual rate of return over the life of an investment.

The chart below shows two 30-year income scenarios. The solid line shows a withdrawal plan that started off with three years of negative returns in a row. The dotted line represents a withdrawal plan with the negative years at the end. Both plans started with \$250,000 and both took out \$12,500 per year inflated by 3% for inflation. No other actions were taken to manage income withdrawals. Both plans had a 6.6% average annual rate of return on the underlying investment for the 30-year period.

Built to last?

Compare early negative versus late negative returns on a hypothetical retirement portfolio.

Chart source: MFS research.

This hypothetical example is for illustrative purposes only and are not intended to predict the returns of any investment choices. Rates of return will vary over time, particularly for long-term investments. There is no guarantee the selected rate of return can be achieved. The performance of the investments will fluctuate with market conditions. Also, note that this example does not take into account other potential sources of retirement income, such as Social Security, corporate pensions, etc.

Keep in mind that all investments carry a certain amount of risk including possible loss of the principal amount invested.

The impact of negative return years early in retirement can result in funds exhausting at a much earlier age than expected.

Clearly different results

It is important to note that Investors A and B had the same annual returns over 30 years, with each portfolio earning an average annual return of 6.6%, except that Investor A's annual returns were inverted to represent Investor B's annual returns. This hypothetical example is for illustrative purposes only and is not intended to represent the future performance of any MFS product or actual market performance.

Comparing gains versus losses in the early years of retirement on a hypothetical portfolio

Investor A

Age	Hypothetical negative early returns	Hypothetical account value	Annual withdrawal adjusted 3% for inflation
61		\$250,000.00	
62	-11.2%	\$209,500.00	\$12,500.00
